Thinking about tomorrow.

## Edge Grinding

The Trimjet represents the future of ski & board edge grinding.

It uses four autofeed modules and two ceramic disc units to grind both base and side edges in a multi-pass automated process with soft start lead-in to give a more gentle sharpening preventing the ski or board hooking when in use

The Trim 71 is the entry level ceramic disc technology machine.

The machine can grind both skis and boards with edge bevelling on both the side and base edges possible.

This is the most popular ceramic edge technology machine in the UK

The Trim 40 is a stand alone belt sander for grinding the side edges of skis and snowboards.

This machine is designed to complement base grinding machines as there is no facility for grinding the base edge.

The Trim NC is the most advanced edge grinding machine in the world. It uses two pairs of ceramic discs and grinds base and side edges with upto five variations in angle along the length of the ski on both base and side AND left and right edges.
