

WINTERSTEIGER

Thinking about tomorrow.

Waxing

The Waxjet 92 is simply the most efficient method of waxing skis & boards in the workshop today.

It uses two Scotchbrite rollers, one of which is heated. The heated roller is used for application and the heat from the roller, together with the heat generated by the friction gives a wax layer that penetrates almost to the level of an iron.

Once the wax has cooled the non-heated roller is used for polishing and buffing the base to give a perfect finish

The best method of waxing is done with an iron - No Question!
The problem is that it is very time consuming and messy when you scrape off the excess wax

We have a range of irons from a small simple wax iron, the Smart Waxer, up to a microprocessor controlled Digital Racing Waxer which is accurate to 2°.

The accuracy of the Digital Racing Waxer is most important for the High Fluro waxes where the additives can be damaged by excessive heat.
